

TRACERCO Diagnostics™ FMI

The only Lloyd's Register Approved method

Minimise time taken to inspect steel jacket members for the presence of water ingress using the **TRACERCO Diagnostics™ FMI** system.

As world leaders in offshore services Tracerco have developed the technology to rapidly screen jacket members for the presence of water which may indicate structural problems. This allows alternative time consuming inspection technologies to be focussed on those areas of the jacket requiring detailed investigation saving the operator costly subsea inspection time.

Benefits of the **TRACERCO Diagnostics™ FMI** system include:

- No need to remove marine growth prior to measurement.
- Speed of measurement – it only takes a few seconds per member.
- Instant diagnosis of flooded or partially flooded members.
- Adaptable to a wide range of ROV's.
- Can be used to water depths of 10,000 feet.
- Diver operated version available.
- 20 years of operational experience has proved the system very reliable.
- Purpose designed computer software used to generate and present results.
- All handling and operating of the system carried out by experienced Tracerco engineers.

Do not gamble on critical inspection by using inferior service providers...use the experts. Call us 24 hours a day, seven days a week.
